

Simpler, more controlled production in the nursery

Arginex Forest Shoot & Root is a nutrition system that simplifies everyday work in the nursery without compromising seedling quality. For nurseries it means more consistent deliveries, greater predictability, and reduced environmental and production risk.

Natural ingredients containing the amino acid arginine.

Arginine is the most nitrogen-rich molecule found in nature.

Nutrients are applied on a schedule, adapted to your operation.

Better roots give better seedlings, which leads to higher quality and survival rate.

The product stays where it is applied instead of leaching out, even after rain.

Why nurseries choose Arginex Forest Shoot & Root

A clear schedule. Less unpredictability.

A fixed, repeatable fertilization schedule that can be planned, monitored, and scaled — without daily adjustments and emergency interventions.

No nitrogen leaching, even when it rains.

Arginex is based on arginine, a positively charged amino acid that binds to the substrate. The nutrients stay in the root zone, even in rain — which reduces environmental risks and future regulatory exposure.

More consistent quality and better root hold.

Seedlings grown with Arginex develop a more well-developed root system, more root hairs, and more mycorrhiza. The result is more consistent quality, easier packing in boxes, and less culling.

Arginex Forest Shoot & Root = Better balance between root and shoot

Better seedlings with fewer resources

Traditional fertilization with ammonium nitrate can result in up to 85% of the nitrogen leaching out, causing eutrophication, higher costs, and poorer use of resources.

Up to -65% less nitrogen leaching

Up to -43% fewer fertilization sessions

Up to -25% lower water consumption

Together, this makes for a robust nutrition system that is less dependent on weather, staffing peaks, and corrective measures.

Get started

Arginex can be introduced in stages, evaluated, and scaled within existing production without disrupting deliveries.

Step 1: Assessment

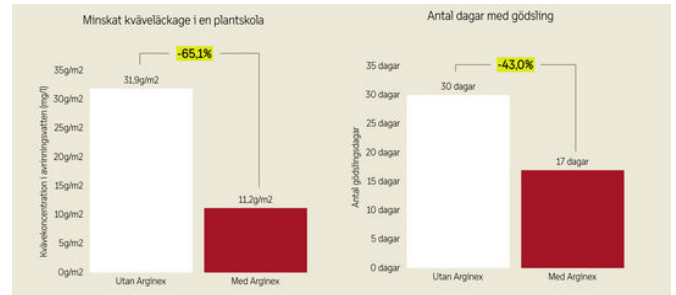

We map your conditions, goals, and current fertilization program.

Step 2: Test program

You get a tailored nutrient schedule (a "recipe") for safe, comparable test cultivation

Step 3: Follow-up

Ongoing support, evaluation, and compilation of results.

Less nitrogen leaching and less stress go hand in hand

"We feed once a week. No special expertise is needed to learn how to supply nutrients to the seedlings, since it follows a schedule. It's actually simpler than managing the watering itself, which takes more of a deft touch."

Operational experience from an established Swedish nursery

A simpler everyday. A better end result.

Arevo helps nurseries simplify their everyday work and produce strong, uniform seedlings — with less waste, less stress, and greater control. For more information, email info@arevo.se or call +46 70 286 86 00.
